Announcing the VGER

The Vanderbilt Transgenic Mouse/ES Cell Shared Resource (TMESCSR) is changing its name. We will now be known as the Vanderbilt Genome Editing Resource (VGER). The rebranding of this shared resource reflects the fact that CRISPR-Cas9 technology has fully replaced the use of mouse embryonic stem cells for performing targeted mutagenesis of mice. VGER will continue to perform pronuclear microinjections, cryopreservation, rederivation and long term storage services to support your use of genetically altered mice.

Keywords: VGER  TMESCSR
