

Bacterial expression, Mammalian Expression, Baculovirus

Expand

## **Bacterial recombinant protein expression**

- We offer expression, optimization, and purification of recombinant proteins in E. coli. We can offer these services with a number of different affinity tags (His, MBP, GST, StrepII, etc.).

## **Mammalian recombinant protein expression**

- We offer expression, optimization, and purification of recombinant proteins in suspension-based mammalian cells. We can also offer these services with a number of different affinity tags (His, Fc, StrepII, etc.).

## **Mammalian cell line optimization**

- Our recently launched cell line optimization service utilizes our automated ClonePIX FL system for clonal selection of highest expressors. This system works much more quickly and effectively than traditional limiting dilution cloning to obtain cell lines with desired expression levels for protein production or utilization in cell-based assays. This service is ideal for optimizing expression characteristics of CHO, HEK293, and Hybridoma expression lines.

## **Special order and custom services available upon request.**
